## BASIC-ABSTRACT:

Glucose polymer compsns. comprise principally glucose polymers with a degree of polymerisation (DP) of 10-40 without significant amts. of lower polymers.

The compsns. pref. contain not more than 10% of polymers with a DP of less than 10 and not more than 15% of polymers with a DP of more than 30. They can be prepd. by hydrolysing starch and isolating a hydrolysate fraction with the required DP range. This fraction can be isolated by membrane filtration, e.g. ultrafiltration or diafiltration, and can then be treated with isomaltase to destroy 1-6 alpha linkages.

The compsns. are suitable for nutrition of patients incapable of feeding themselves or patients with pancreatic disfunction. They have good digestion and absorption properties when administered enterally (orally or by gastric catheter) and are non-hypertonic.
